

— THE MEETING MESSAGE

Audi can catch quality and machine problems earlier.

EVOCON turns existing factory images, sensor signals and process logs into heatmaps, risk scores and a ranked list of what to inspect first.

One line

One process

4-6 week pilot

Clear go / no-go

— WHY AUDI NEEDS THIS

Premium quality is expensive when detection is late.

Late visual defects

Small surface, assembly or supplier defects become expensive once they move downstream.

Machine drift

Robots, tools, presses, conveyors and test benches can drift before a hard failure appears.

Signal overload

Cameras, PLC, SCADA, torque logs and test logs are usually reviewed separately.

Alarm fatigue

Teams do not need more dashboards. They need a reliable priority list.

The pilot attacks five cost levers.

01

Less scrap

Catch quality drift before a full batch is affected.

02

Less rework

Send human review to the parts that matter first.

03

Less downtime

Spot machine drift before it becomes a stoppage.

04

Faster launches

Find process instability during ramp-up and changes.

05

Better suppliers

Rank lots, images or stations with evidence.

— WHAT THE PRODUCT IS

An inspection and early-warning copilot for the plant.

Visual quality

Images in. Heatmaps and review ranking out. Best for surfaces, welds, paint, PCBs, packaging and assemblies.

Machine risk

Vibration, current, temperature, torque, SCADA or test logs become a top-risk queue.

Process deviation

The system learns normal process behavior and marks when reality starts to drift.

— WHY EVOCON IS THE BEST PILOT PARTNER

Automation experience plus practical AI validation.

Not a generic AI demo

EVOCON already speaks factory language: PLC, robotics, production support, onsite/offline work and industrial project delivery.

Validation-first approach

We compare against simple rules and strong baselines. If the pilot does not improve the current process, the customer still gets a clear go/no-go report.

Local, low-risk start

The first pilot can run locally on historical data. No plant integration is required to prove the first business case.

Actionable output

The output is not a research metric. It is a ranked queue: part, cycle, machine, batch or line.

— WHAT AUDI WILL SEE

Clear evidence, not a black box.

Part A-1842		Review
Station 07		Review
Tool M02		Monitor
Batch 1811		Normal

The operator sees where the anomaly is, when the deviation started, and what to check first.

4-6 weeks. One process. Measured value.

1. Pick use case

Visual defect, machine drift, test-log anomaly or supplier quality.

2. Data audit

Check images, sensors, timestamps, labels and process context.

3. Build baselines

Compare against current rules and practical industrial baselines.

4. MVP model

Heatmaps, risk scores, temporal deviation and top-k ranking.

5. Decision

Business report, demo and go/no-go integration plan.

— WHAT WE NEED FROM AUDI

Give us one narrow process to prove value.

1 One process owner

Someone who knows what late detection costs and what a useful alert looks like.

2 One data owner

Historical images, sensor traces, test logs, PLC/SCADA exports or quality events.

3 One success metric

Earlier warning, fewer false alarms, less rework, better inspection ranking or faster root-cause review.

Ask for the next step:

"Let us choose one production process and run a 30-minute technical scoping call. If the data is suitable, EVOCON can deliver a pilot result in 4-6 weeks: heatmaps, risk ranking, metrics and a clear go/no-go recommendation."
